 - CSS3 : 2007

2. Explain Types Of CSS/ Declaration Ways of CSS ?

- CSS is Cascading Style Sheet is a language which is used to add style in HTML
- There are 3 types of CSS or 3 ways to define CSS ,
 - Inline CSS
 - Internal CSS
 - External CSS

1) Inline CSS :

- In Inline CSS we define CSS in same line means tag itself using style attribute but its not preferable
- It is not recommended for large project

2) Internal CSS :

- In internal CSS we define CSS separately in same file using Style Tag and this style tag must be the outside of the body tag
- It is used for style the single webpage

3) External CSS :

- In External CSS we define CSS in external or separate file and this most used CSS in Frontend
- Most recommended CSS for the large project

3. What is Simple selector in CSS ?

- Simple selector targets or selects html elements based on their name, id, class and attributes
- This simple selector is basic selectors in CSS
- There are types of Simple selector is ,
 - Tagname or Element Selector
 - Id Selectors
 - Class Selector
 - Universal Selector
 - Grouping Selector

1) Tagname or Element Selector :

- This Selector target or select the html tag based on their name

2) id Selector (#) :

- This selector target or select this single html tag with a specific id
- An id should be unique in a webpage

3) class Selector (.) :

- This selector target or selects the all html elements with class
- An multiple html elements can have same class

4) universal Selector (*) :

- This selector target or selects all the html elements from the webpage

5) Grouping Selector (,) :

- This selector targets or selects two or more html elements at a time
- It is used to give same style to multiple html element

4. What is Combinator selector in CSS ?

- This Selector defines a relationship between two or more html elements
- They help you to select or target html element based on their position in HTML structure
- There are types of Combinator Selector are ,
 - Descendant Selector
 - Child Selector
 - Adjacent sibling Selector
 - General sibling Selector

1) Descendant Selector (Space) :

- This selector target or selects the html elements that's are inside the another element
- We use space between parent and child elements to select html element

2) Child Selector (>) :

- This selector target or selects the direct child elements of parent
- We use greater than symbol between parent and child selector to select child elements

- This selector target or select the html element that come after another element
- We use plus symbol between two elements to selects html element

4) General sibling Selector (~) :

- This selector targets or selects the all sibling element that come after specific element
- We use hyphen symbol between two html elements to select html element

5. What is Attribute selector in CSS ?

- Attribute selector are used to select html element based on their Attribute values
- They are helpful when you don't want to select html element by their id or class
- There are types of Attribute selectors are ,
 - Attribute Selector
 - Attribute with value Selector
 - Attribute start with value Selector
 - Attribute ends with value Selector
 - Attribute contain value Selector

1) Attribute Selector :

- Selects the all element that have specified Attribute
- Syntax ,
 - [Attribute] :

2) Attribute with value Selector :

- Selects the elements whose attribute values exactly matches the specified value
- Syntax ,
 - [Attribute = "Value"] :

3) Attribute starts with value Selector :

- Selects all the elements whose attribute value starts with specified text
- Syntax ,
 - [attribute^="a"] :

4) Attribute ends with value Selector :

- Selects all the elements whose attribute value ends with specified text
- Syntax ,
 - [Attribute\$="z"] :

5) Attribute contain value Selector :

- Selects all the elements whose attribute value contains specified text
- Syntax ,
 - [Attribute*="google"] :

6. What is Pseudo class selector in CSS ?

- Pseudo class are divided into two parts ,
 - Dynamic Pseudo class selectors
 - Structural Pseudo class selector

1) Dynamic Pseudo class selector :

- Dynamic Pseudo class selector selects the html elements based on their current states and user interactions like hovering, active and focus
- There are Dynamic Pseudo selectors are ,
 - Hover
 - Active
 - Focus

A) Hover =

- Selects the element when mouse is hovering on it

B) Active =

- Selects the element when element is being clicked

C) Focus =

- Selects an input field when its receiving the focus

2) Structural Pseudo class selector :

- There are Structural Pseudo class selectors ,
 - First-child
 - Last-child
 - Nth-child
 - First-of-type
 - Last-of-type
 - Nth-of-type

A) first-child =

- Selects the first child element of its parent element

B) last-child =

- Selects the last child element of its parent element

C) nth-child =

- Selects any child elements of its parent element

D) first-of-type =

- Selects the first child element of its respective to same type of parent element

E) last-of-type =

- Selects the last child element of its respective same type of parent element

F) last-of-type =

- Selects the any child element of its respective same of parent element

7. What is Pseudo Element selector in CSS ?

- Pseudo element selector are denoted by double colon (::)
- This are the Pseudo Element selectors are ,
 - First-letter
 - First-line
 - Before
 - After
 - Selection
 - Markers

1) first-letter =

- This selector target the first letter of selected element

2) first-line =

- This selector target the first line of selected element

3) before =

- This selector inserts the content before the element content
